The new version of Lightroom 5 allows you to import and organize your photos into customizable collections that make it easy to find the images of particular subjects, images you like, and those you want to display in a particular mood. Once you have found the sort of images you are interested in, you can group them into collections, create smart collections, make collections based on location, and more. With an automatic start-up feature, Lightroom will have your latest images waiting any time that you open it. Another special feature is the ability to create a scheduled import function, which allows you to schedule the removal of previous imported photos from the system each time you import a new batch. The first thing that you'll notice is that Lightroom is now bundled with a new RAW converter based on SilkyPix. This new converter not only works with Fujifilm X-Trans RAW files, but also with Fujifilm X-Pro II and X-E2 sensors, and can convert any file format into an X-Trans™ RAW file. So, in other words, you can import images from all your X-Pro cameras, as well as from your Fujifilm X-E2. Fujifilm has also added 35 new X-Trans RAW files to its system of images that can be downloaded online. There are no filter presets other than what is already present in Lightroom, so you just need to work with a couple of quick brush settings. The Lightroom 5 update supports the X-Trans digital RAW file format, including double card readers, film-based RAW, ARRI RAW, and Fujifilm X-Trans RAW. Importing an X-Pro or X-E2 RAW file into Lightroom automatically creates a new library tab in the Develop module, enabling you to edit your X-Trans RAW files. Importing a RAW file from an X-Pro3 into Lightroom automatically creates a new tab with the "Convert" feature in the Adjust module.

2. You have to be careful what you do to the colors because the colors are the basis for the effects you are going to apply. For example, if you are using hue shifting, your image will look fine, but if the right colors are not there the effect won't work. Remember: The same goes with saturation, contrast, and more. 3. Next, try to find the important parts in the image. There are certain spots where the focus of the shot is, like the eyes, the nose, or the mouth. If there is an important subject

in the image, get to know where it is. Then look at the location and figure out what the important parts in the image are. They will help you to tell what effect would do the image good. If your subject is in the middle of the image or in the shadows, add contrast. If the shot is in the highlights, make them appear less vivid! 4. The next step would be to choose the type of blending to apply. There are many types of blending you can master, like clone, dodge, burn, and dodge and burn. You can also add lot of filters, text, and borders to make your image stand out or you can change them. These can do wonders in the right hands. Tutorials are a great way of giving new design tools to Photoshop novices. You can pick from a wide range of video tutorials, or even Photoshop's own tutorials to learn more about anything you need to know. The best thing about a tutorial is that, by watching someone do what you want to do, you learn it without having to do complicated research on your own. *Adobe Photoshop is a computer program that allows a user to create high quality digital images.
