The new update is amazing clean. The windows just load up and you are going to get to your program. I love everything about my new windows 8 computer, however I am disappointed in how slow Photoshop is to open. It takes 4 or 5 min. to open and edit a document and I just can't wait. This is just another Adobe Photoshop update. What's the point? New features? Yes the 'Studio' is nice, but why do you need Studio? I use Photoshop for editing photos! I use the old version. It does what I needed in the past. Many of the new features are not needed or I can do that in 10 seconds." I did downgrade to LR 4.3.1. I also have the DxO camera app installed which I find much better than Lightroom - so far it is much faster. I also love the convenience of using the camera app with the new HDR feature - much faster and easier to do. I am also not too sure how extensive the new module capabilities are. For one thing in my Photoshop CS6 a folder called Actions was added. It has had some software, and also seems to have a class called Smart Objects. As far as this NDA is concerned the biggest difference in the new build is the fact that the new build of Lightroom isn't even configured while I have a module running in PS. Also, events are working in the PS modules. Photoshop will still take time running in PS, but the events will go right through. PSD feels slow? I don't think so. My biggest gripe is the lack of flexibility in PS. I think that the new module system may be ideal for people who want to enhance images, but is too inflexible for those people who want to quickly enhance a few images. How much more would you need to manipulate an image? Do you really need to use one of those filters? The fact that it won't report the use of a new image macro even if you place an SD card into a new camera tells me that it is not particularly flexible. PS is so

slow, I can't do it. So do I understand that this module is a way to increase that flexibility?

Each of the editing programs offered in the Creative Cloud subscription have their own accounting system when using the funds. For example, if you decide to pay for Lightroom CC, you can divide all the money you pay for that product during the month between the software itself, the photo books it creates, or the books it will give you in the subscription for you to print. You can then use the money saved or create a budget for the upcoming month. After choosing the type of images you want to pay for, you can also choose which program groups you want to be included in your subscription. I suggest including yourself and a friend you are willing to lend your services to. You and your friend can split the cost and pay for half up front. Photoshop is absolute the professional standard for photo editing. While Photoshop in its current form is still inadequate in many respects, seeing it mature alongside other large platforms is exciting. Prediction: as much a boon to the teams behind the engineering resulted is to the users. From an editorial perspective, Photoshop has great products for red eye recovery, removing blemishes, white balancing, removing lens distortion,... and more. Photoshop also has a number of tools that are easy to use and accessible for consumers such as drawing tools, smart filters and even the Web app (for mobile-only edits). While you can't argue with the track record of Photoshop, the software platform also suffers from a lack of support in editors. The limited utility of the Office Lens app is just one example. Apparently, there is some interest in bringing all of Adobe's creative apps under the Creative Cloud umbrella, but that's a huge enterprise and we're not quite there yet. Still, with Photoshop Cloud this dream can pretty much become reality. 933d7f57e6
